

Gun Safety

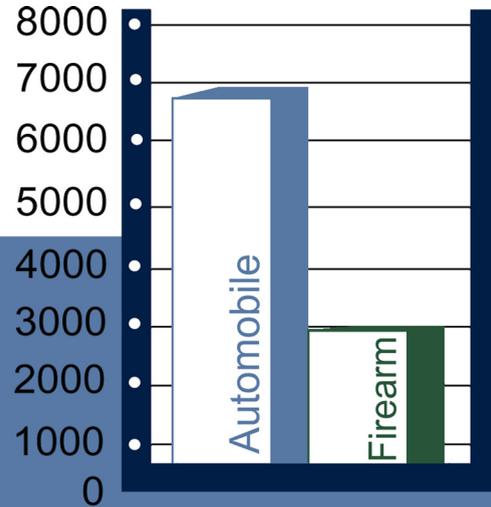

is a National Priority

Kids love to explore.

Traditional home security methods including gunlocks are often not child-proof. Hidden keys can be found. Pass codes are often discovered.

The only effective childproofing methods are those that prevent access by unauthorized adults.

Imagine,

Access Control at the Touch of a Finger

The Most Mature Biometric Technology is Fingerprint Technology

Frequently Asked Questions

Overview

BioVault was developed as the solution to access control.

BioVault provides safe storage and easily controlled access for handguns, weapons, ammunition, jewelry and other valuable items including; pharmaceuticals, coins, stocks, bonds, critical data and personal documents.

Designed to be nearly impenetrable to attack and unauthorized access, **BioVault** utilizes the verification of an authorized persons' fingerprint to control and permit access.

BioVault is easily programmable and can store up to 15 authorized fingerprints in its memory. You decide who gains access to the **BioVault**.

BioVault has no override keys, no special security codes, just the biometric characteristics of your individual fingerprints.

Constructed of heavy-duty 12-gauge steel and state-of-the-art technology, BioVault will give you years of peace of mind, secure access control and safe storage of your valuables.

Almost 50% of all Biometric Technology is based on fingerprint recognition.

BioVault utilizes highly reliable capacitance technology and is nearly tamper-proof. BioVault utilizes the same technology and software used by the FBI.

BioVault's patent-pending technology is the culmination of over 20-years of biometric development. BioVault is the first stand-alone consumer biometric access control system. It requires no external computer or power to function, no key or card to provide override, and is the only product on the market that opens solely with biometric access.

The power management system is provided by three D-cell batteries that last up to one year. An auxiliary AC/DC converter conveniently plugs into any household outlet to provide an alternate power source. Fail-safe memory retains fingerprint data even during complete battery or electrical failure.

BioVault is your solution when access control is your first concern.

If the batteries go dead, does the BioVault lose my fingerprints?

BioVault uses the same non-volatile memory used in cell phones. The memory stays intact even if there is no power supplied for years. BioVault is designed to signal you when the batteries are low, just like a smoke detector. If for some reason it goes completely dead, plug the BioVault into an electrical outlet and it will open with your enrolled fingerprint.

Can anyone steal my fingerprints?

No. The SB-5 biometric processor in BioVault reduces your fingerprint to a binary number that is stored in memory. This number is compared to the fingerprint submitted for comparison.

How many people can I enroll in my BioVault?

BioVault is easily programmable and can store up to 15 authorized fingerprints in its memory. We recommend that you enroll two fingers, one from each hand; just in case you have a bandage on one finger, you can use the other.

- Solid 12-gauge steel construction.
- Capacitive Biometric Sensor.
- 15 fingerprint capacity.
- Quick opening, easy access.
- 12.5 inches wide, 17 inches long, 3.5 inches deep. Large enough to store two or more hand guns with ammunition.

For the ultimate in access control.

Control who has access to your hand guns and other valuables.

Enjoy safe, effective peace of mind with your own BioVault.
